

**AMENDMENTS TO THE CLAIMS**

1. (Currently amended) A telecommunication device comprising:

a telephony interface, said telephony interface for receiving a telephone call and identifying a dialed telephone number associated with the call, said telephony interface using the dialed telephone number to retrieve at least ~~[[a]]~~ one wireless telephone number and at least one user preference from a storage medium, and said telephony interface using said at least one retrieved user preference to route the call to at least one wireless destination telephone number,

wherein said at least one wireless destination telephone number is selected from the group consisting of said retrieved wireless telephone number and a voice mailbox telephone number, ~~and~~

~~wherein~~ said telephony interface routes the call to two wireless destination telephone numbers substantially simultaneously, and

wherein said dialed telephone number and said at least one wireless destination telephone number are associated with an enterprise telecommunication network consisting solely of wireless devices.

2. (Currently amended) The device of claim 1, wherein a first wireless destination telephone number corresponds to said retrieved wireless telephone number and a second wireless destination telephone number corresponds to a retrieved second wireless telephone number.

3. (Currently amended) The device of claim 2, wherein said telephony interface routes the call to a third wireless destination number corresponding to said voice mailbox telephone number after a predetermined time as defined by said at least one retrieved user preference.

4. (Original) The device of claim 3, wherein said predetermined time corresponds to a number of telephone rings defined by said at least one retrieved user preference.

5. (Currently amended) The device of claim 1, wherein said telephony interface routes the call to a first wireless destination telephone number corresponding to said retrieved wireless telephone number and to a second wireless destination telephone number corresponding to a retrieved second wireless telephone number as defined by said at least one retrieved user preference.

6. (Currently amended) The device of claim 5, wherein said at least one retrieved user preference defines a first ring count for the call to said first wireless destination telephone number and a second different ring count for the call to said second wireless destination telephone number.

7. (Currently amended) The device of claim 6, wherein said telephony interface routes the call to a third wireless destination telephone number corresponding to said voice mailbox telephone number after said telephony interface rings said first wireless destination number more than said first ring count.

8. (Previously presented) The device of claim 1, wherein said telephony interface routes the call to said voice mailbox telephone number.

9. (Currently amended) The device of claim 1, wherein said telephony interface prompts a caller of the telephone call with a menu of call destination options and said telephony interface places the call to at least one wireless destination telephone number in accordance with an option selected by the caller.

10. (Original) The device of claim 1, wherein said telephony interface communicates with a private branch exchange, and wherein at least one of said at least one destination telephone numbers is associated with the private branch exchange.

11. (Original) The device of claim 10, wherein said at least one destination telephone number associated with the private branch exchange is associated with a cellular telephone.

12. (Original) The device of claim 11, wherein the cellular telephone can operate independently from said device.

13. (Currently amended) The device of claim 10, wherein another of said at least one wireless destination telephone number is associated with a pager.

14. (Currently amended) The device of claim 10, wherein another of said at least one wireless destination telephone number is associated with a personal digital assistant.

15. (Currently amended) The device of claim 1, wherein said telephony interface receives the call from a public switched telephone network, and wherein at least one of said at least one wireless destination telephone number is associated with a private branch exchange.

16. (Currently amended) The device of claim 15, wherein said at least one wireless destination telephone number associated with the private branch exchange is associated with a cellular telephone.

17. (Original) The device of claim 1, wherein said telephony interface is connected to a local area network and said at least one user preference is input via the local area network.

18. (Original) The device of claim 1, wherein said telephony interface is connected to the Internet and said at least one user preference is input via the Internet.

19. (Currently amended) A telecommunication device comprising:

a telephony interface coupled to an enterprise telecommunication network, said telephony interface receiving a telephone call from a wireless telephone and identifying a wireless telephone number of the wireless telephone, said telephony interface using the wireless telephone number to retrieve a first enterprise telephone number associated with the enterprise telecommunication network and with the wireless telephone and to retrieve at least one user preference from a storage medium, said telephony interface generating and sending a simulated dial tone to the wireless telephone to provide access to the enterprise telecommunication network based on said at least one user preference and at least one enterprise preference associated with said first enterprise telephone number,

wherein said enterprise telecommunication network consists solely of wireless communication devices.

20. (Original) The device of claim 19, wherein said at least one enterprise preference comprises a security group defining authorized outbound call access of a user of the wireless telephone.

21. (Original) The device of claim 19, wherein said at least one user preference comprises a dial tone timeout period, wherein a user of the wireless telephone is prevented from placing a call after the dial tone timeout period expires.

22. (Original) The device of claim 19, wherein said telephony interface further comprises:

means for receiving a second telephone call, said second telephone call being placed to said first enterprise telephone number associated with the enterprise telephone network;

means for identifying the first enterprise number;

means for using the first enterprise telephone number to retrieve at least the wireless telephone number; and

means for using said at least one user preference to route the second call to at least one destination telephone number, wherein said at least one destination telephone number is selected from the group consisting of the wireless telephone number and a voice mailbox telephone number.

23. (Original) The device of claim 22, wherein said telephony interface routes the second call to two destination telephone numbers simultaneously, a first destination telephone number corresponding to the wireless telephone and a second destination telephone number corresponding to a retrieved second telephone number.

24. (Original) The device of claim 23, wherein said telephony interface routes the second call to a third destination number corresponding to said voice mailbox telephone number after a predetermined time as defined by at least one retrieved user preference.

25. (Original) The device of claim 22, wherein said telephony interface routes the second call to a first destination telephone number corresponding to the wireless telephone number and to a second destination telephone number corresponding to a retrieved second telephone number in a sequential manner and as defined by at least one retrieved user preference.

26. (Currently amended) A method of operating a wireless connect unit to implement a virtual dual line telephone interface into an enterprise telecommunication network location having a single line telephone interface, said method comprises:

connecting the enterprise telecommunication network to a wireless connect unit;

providing at least one wireless telephone to the location;

routing a telephone call made to an extension of the enterprise network to the wireless connect unit;

identifying the extension from the routed telephone call;

using the identified extension to retrieve a first telephone number associated with the wireless telephone and a second telephone number associated with a telecommunications device;

routing the telephone call to at least one destination telephone number, wherein said at least one destination telephone number is selected from the group consisting of the first and second telephone numbers, and

wherein the wireless telephone can receive the call if the device associated with the second telephone number is unable to receive a call and the device associated with the second telephone number can receive the call if the wireless telephone is unable to receive the call,

wherein the call is routed to the two telephone numbers substantially simultaneously, and

wherein extensions of the enterprise telecommunication network are solely associated with wireless devices.

27. (Currently amended) A method of providing telecommunications between users of first and second enterprise telecommunication networks, said method comprising:

connecting each enterprise telecommunication network to a respective wireless connect unit;

providing at least one wireless telephone to the users of the first and second telecommunications networks;

routing a telephone call made from a first user of the first enterprise network to the wireless connect unit connected to the second enterprise network, the telephone call being for an extension of the second enterprise network;

identifying the extension from the routed telephone call;

using the identified extension to retrieve a first telephone number associated with a wireless telephone and a user preference; and

routing the telephone call in accordance with the user preference to at least one destination telephone number,

wherein said at least one destination telephone number is selected from the group consisting of the first telephone number and a voice mailbox telephone number, and

wherein extensions of the enterprise telecommunication network are solely associated with wireless devices.

28. (Currently amended) A method of providing telecommunications to a user of an enterprise telecommunication network, said method comprises:

connecting the enterprise telecommunication network to a wireless connect unit;

providing an extension of the enterprise network associated with the user;

providing a wireless device to the user;

routing a telephone call made to the extension to the wireless connect unit;

identifying the extension from the routed telephone call;

using the identified extension to retrieve a first telephone number associated with the wireless device and at least one user preference; and

routing the telephone call in accordance with the user preference to at least one destination telephone number,

wherein said at least one destination telephone number is selected from the group consisting of the first telephone number and a voice mailbox telephone number, and

wherein the enterprise telecommunication network consists solely of wireless devices.

29. (Currently amended) A method of providing access to an enterprise telecommunication network from a wireless telephone, said method comprises:

receiving a telephone call from the wireless telephone;

identifying a wireless telephone number of the wireless telephone;

using the wireless telephone number to retrieve an enterprise telephone number associated with the enterprise telecommunication network;

generating a simulated dial tone;

sending the simulated dial tone to the wireless telephone; and

providing telecommunication access to the enterprise telecommunication network based on at least one user preference and at least one enterprise preference associated with the retrieved enterprise telephone number,

wherein the enterprise telecommunication network consists solely of wireless devices.
